

# Hallucination Cascade Forecasting Results

Cleaned results report | Wilson 95% CIs | HalluHard x HallucinationResearchTest

## Status

Captured 61 / 100 seeds, 302 / 500 branches. Domain mix of captured seeds: legal 27, medical 16, research 18. Finish the run with --resume before treating percentages as final.

## Headline findings

On 60 complete seeds, skeptical recovers 39 times and dependency-seeking recovers 0 (same-seed McNemar). 21/60 seeds recover under skeptical AND entrench under dependency-seeking. Topic-shift is not a safe off-ramp: entrenchment vs dependency-seeking is not significant (McNemar  $\chi^2=0.78$ ,  $p=0.38$ ). Turn-1 corrected forecasts a CORRECT branch: 16/16 (100%). Accepting-style recovery is domain-specific: research 0/17, legal 9/27, medical 0/16.

## Aggregate (Wilson 95% CI in brackets)

| category           | n  | DROP             | CORRECT          | REPEAT           | DEPEND        |
|--------------------|----|------------------|------------------|------------------|---------------|
| dependency-seeking | 61 | 28 (46%) [34-58] | 0 (0%) [0-6]     | 29 (48%) [36-60] | 4 (7%) [3-16] |
| neutral            | 61 | 53 (87%) [76-93] | 6 (10%) [5-20]   | 1 (2%) [0-9]     | 1 (2%) [0-9]  |
| skeptical          | 60 | 12 (20%) [12-32] | 39 (65%) [52-76] | 8 (13%) [7-24]   | 1 (2%) [0-9]  |
| accepting          | 60 | 49 (82%) [70-89] | 9 (15%) [8-26]   | 1 (2%) [0-9]     | 1 (2%) [0-9]  |
| topic-shift        | 60 | 33 (55%) [42-67] | 1 (2%) [0-9]     | 26 (43%) [32-56] | 0 (0%) [0-6]  |

## By domain

| domain   | n   | DROP             | CORRECT          | REPEAT           | DEPEND        |
|----------|-----|------------------|------------------|------------------|---------------|
| research | 87  | 57 (66%) [55-75] | 12 (14%) [8-23]  | 14 (16%) [10-25] | 4 (5%) [2-11] |
| legal    | 135 | 71 (53%) [44-61] | 32 (24%) [17-32] | 31 (23%) [17-31] | 1 (1%) [0-4]  |
| medical  | 80  | 47 (59%) [48-69] | 11 (14%) [8-23]  | 20 (25%) [17-35] | 2 (2%) [1-9]  |

## Same-seed McNemar

| contrast                          | metric        | a_only | b_only | chi2  | p        |
|-----------------------------------|---------------|--------|--------|-------|----------|
| skeptical vs dependency-seeking   | CORRECT       | 39     | 0      | 37.03 | 1.17e-09 |
| skeptical vs neutral              | CORRECT       | 35     | 2      | 27.68 | 1.43e-07 |
| skeptical vs accepting            | CORRECT       | 32     | 2      | 24.74 | 6.58e-07 |
| skeptical vs topic-shift          | CORRECT       | 38     | 0      | 36.03 | 1.95e-09 |
| dependency-seeking vs neutral     | REPEAT+DEPEND | 31     | 1      | 26.28 | 2.95e-07 |
| dependency-seeking vs skeptical   | REPEAT+DEPEND | 27     | 4      | 15.61 | 7.77e-05 |
| dependency-seeking vs accepting   | REPEAT+DEPEND | 31     | 1      | 26.28 | 2.95e-07 |
| dependency-seeking vs topic-shift | REPEAT+DEPEND | 19     | 13     | 0.78  | 0.377    |

## What to update

What to update before the next full run

=====

0. Expand the judged seed pool. The formatted PDF sampled 100 of 475 hallucinating answers (143 research, 126 legal, 206 medical). This repo's forecasting/batch\_results.jsonl only has the 60-question pilot (18 hallucinating). Re-generate and judge the full HalluHard splits first:  
python forecasting/pipeline.py answer --domain all --resume  
python forecasting/pipeline.py judge --domain all --resume  
Or, for a new model:  
TEST\_MODEL=Qwen/Qwen3.5-2B python forecasting/generate\_seeds.py

1. Finish the captured experiment. Planned design is 100 seeds x 5 strategies x 5 turns (500 branches / 2500 answers). The formatted PDF stopped at 61 seeds / 302 branches; seed 61 only has dependency-seeking and neutral.

# Hallucination Cascade Forecasting Results

*Cleaned results report | Wilson 95% CIs | HalluHard x HallucinationResearchTest*

Re-run with --resume so completed branches are skipped:

```
python forecasting/pipeline.py tree --max-seeds 100 --levels 5 --resume
python forecasting/pipeline.py label --resume
python forecasting/pipeline.py report
```

2. Use round-robin domain sampling (now the default). The PDF planned 34/33/33 research/legal/medical but the captured set drifted to 18/27/16 because a shuffled list was truncated. Round-robin keeps a stopped run balanced.
3. Judge every turn with DROP / CORRECT / REPEAT / DEPEND, then derive the branch outcome. The formatted PDF mixed two vocabularies (persisted vs persisted\_active/dormant) and some branches disagree with their turn states (e.g. seed 1 accepting is five "persisted" turns labeled CORRECT). Derived outcomes remove that inconsistency.
4. Turn thinking off and strip <think> blocks. Qwen3.5 otherwise spends the token budget on chain-of-thought and echoes the question. The merged runner passes enable\_thinking=False and strips both.
5. Score teacher-forced token probability of the emitted answer, not max-softmax. Max-softmax is peakedness and tracks entropy; forecasting needs the probability of the tokens the model actually wrote. Stored on each branch as init\_average\_confidence / init\_average\_entropy / etc.
6. Generate seeds with the model under test. Do not score Llama (or any other model) on Qwen's answers:  
TEST\_MODEL=... python forecasting/generate\_seeds.py  
python forecasting/pipeline.py tree --seeds forecasting/seeds\_<slug>.jsonl --resume
7. Prefer the 5 pure-strategy branches over a mixed 4^N grid. Mixed-style sequences are not interpretable as a user-strategy effect, which is the claim the PDF tables make.
8. Report with Wilson 95% CIs and a domain breakdown. Percentages in the formatted PDF are point estimates on an incomplete sample; CIs and the domain split are what a reader should see.
